

MedTrac.net[®]: Smart Locator System

We get the nurse to the patient *faster* than anyone.

MedTrac.net: Smart Locator System

A smart locator system that can locate and track staff, patients and equipment on a real-time basis – providing valuable information and leading to efficient utilization of hospital resources and better patient care.

Underutilization of resources is a major concern for today's hospitals, leading to increased costs and lower levels of patient satisfaction. The ability to track and analyze the movement of staff members and equipment enables hospital management to maximize productivity and continue to deliver outstanding patient care. Understanding the impact that tracking networks have on the delivery of cost-efficient, high-quality patient care, Intego™ developed MedTrac.net.

In this smart locator system, staff members wear lightweight identification badges that transmit their location to receivers in rooms and corridors throughout the hospital. Each badge transmits a unique code that identifies staff members by name and nursing level. When integrated with the Intego ProNet.net™ Nurse Call System, MedTrac.net is able to locate staff members throughout the entire facility.

MedTrac.net can also locate and track the location of important equipment throughout the hospital. This capability eliminates the need for staff members to roam the hospital searching for equipment. It can also lead to greater efficiencies and cost savings as hospital equipment utilization increases and rental equipment costs are reduced.

Personnel Tracking

- Four levels of identification (RN, LPN, CNA and Ancillary or Patient).
- Displays the real-time location of staff members wearing badges.
- Integrated emergency feature button on the badge allows staff to signal for help.

Equipment Tracking

- Displays the real-time location of all equipment that has a transmitter attached.
- Serial number of each piece of equipment is displayed.

System Reporting

- Reports may be generated showing the:
 - movement of persons or equipment throughout the hospital
 - personnel movement into and out of specific areas – with time stamps
 - location of selected equipment – simplifying the scheduling of preventive maintenance
- Reports may be generated for individuals, units or the entire facility.
